

TASK ONE – Phishing Analysis Report by AUannat

Phishing Email – 1

1. The sender poses to be Amazon but the domain name has a slight difference, *mazon.com* instead of *amazon.com*. This makes the email very suspicious.
2. The first red flags are the domain name mismatch and generic greeting. There's also urgency and threat in the tone of the email.
3. There are two links in the email that looks extremely suspicious especially the hovered one which shows an entirely different link. There's also the case of the domain.
4. The attacker is clearly trying to get the recipient's credentials seeing as there is an instruction to confirm account ownership which can involve logging in or providing some personal information.
5. This is a phishing attempt, specifically, clone phishing because of the clear signs and IOCs.
6. The recipient should immediately report the email as spam and block the sender email address.

Phishing Email – 2

1. There is not sufficient information to know if the sender is legitimate or not.
2. Evident red flags include generic greeting, grammatically wrong texts and links that look out of place. As someone who has received emails from Netflix, links in buttons are not underlined.
3. No links physically seem suspicious. There's no visible domain.
4. If this were a phishing attempt, it'd be an attempt at credential theft which can result in financial gain seeing as the recipient was encouraged to update their billing information.
5. There's a high likelihood that it is a phishing attempt because of the grammar errors, generic greeting and other IOCs.
6. The recipient should make further investigations by hovering over the links and scanning them with TI platforms. If further investigations show that it is malicious, immediate actions such as reporting mail as spam should be taken.

Phishing Email – 3

1. The sender domain looks suspicious because the domain is written in a different format.
2. There is urgency in the tone of the email.
3. There are links, but no clear evidence that they are suspicious.

4. The attacker's plan is to get the recipient's credentials.
5. This is a phishing attempt, most likely clone phishing because of the domain mismatch, urgency and some inconsistency in the texts at the footer.
6. The recipient should investigate the links to be sure if the email is suspicious or not. If it is, the email should be reported as spam immediately and the address should be blocked.
