

PACKET ANALYSIS LAB SETUP REPORT

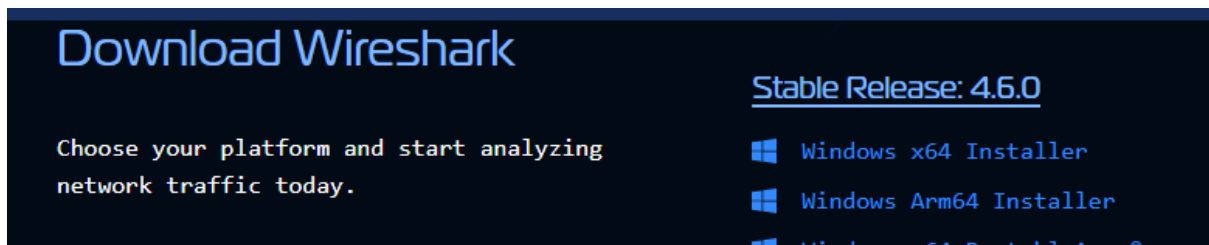

By AlJannat A. Uthman

Summary

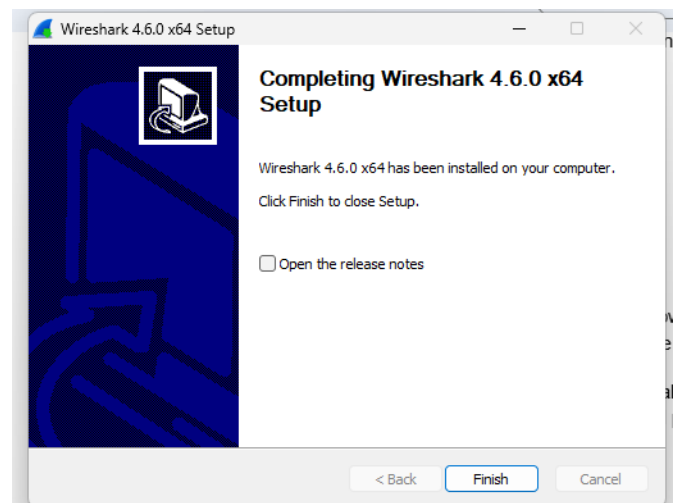

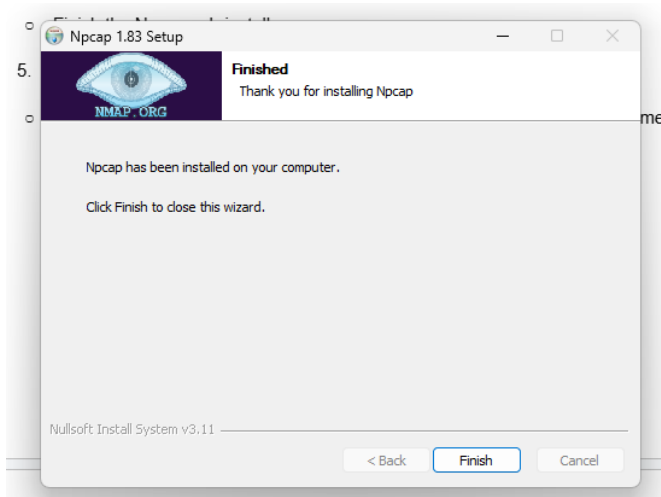

This report covers my step-by-step process of upgrading my home lab with packet analysis tools. I have Kali Linux VM installed already and I will be detailing the process of setting up Wireshark and Network Miner on Windows.

Wireshark Setup

The following are the steps I took to setup Wireshark - from download to full installation.

1. Got the installer package from Wireshark's official site:
<https://www.wireshark.org/download.html>.
2. Ran the installer as administrator.
3. Responded to the prompts and added ticked a few add-ons/components include Ncap.
4. Finished installation.

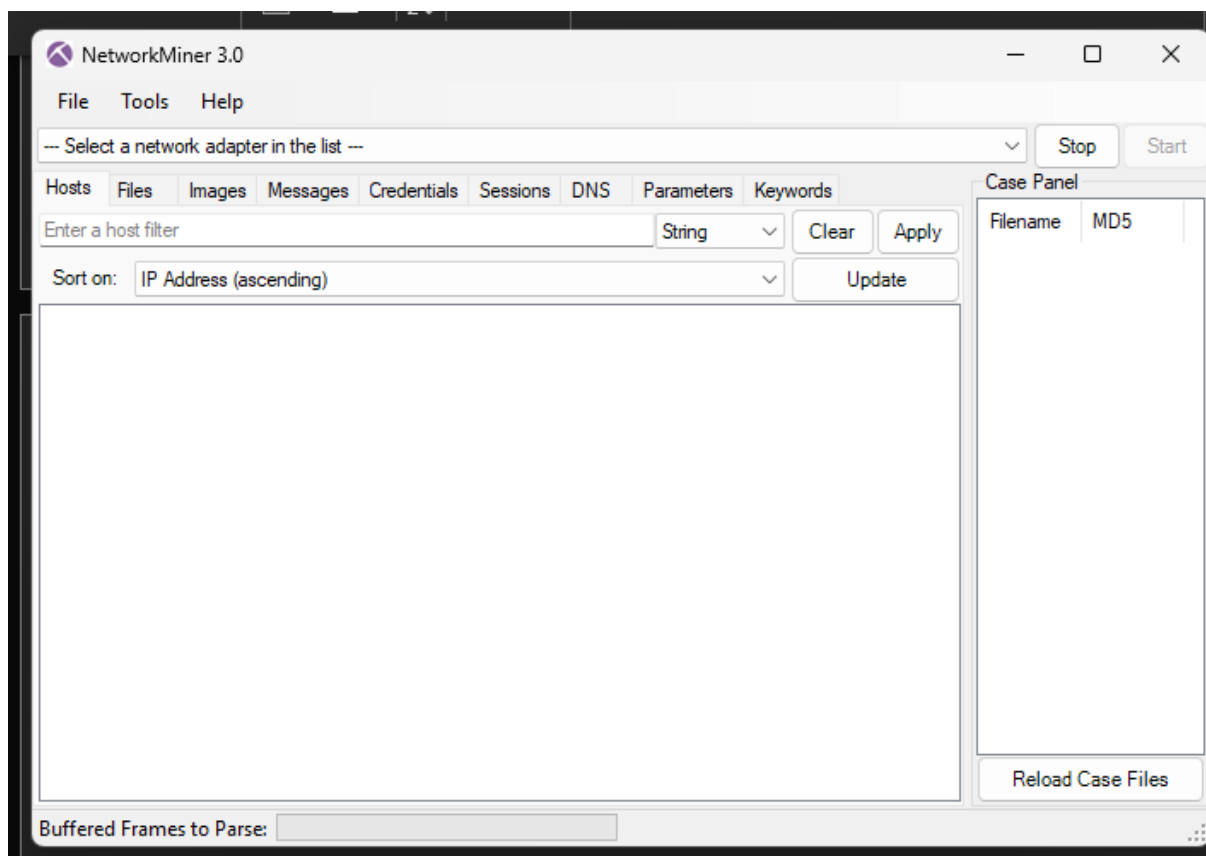

Network Miner Setup

This is my first time setting up this tool as I have not heard of it prior to this lab setup exercise unlike Wireshark. Below is the entire process involved.

Advertisement and tracker detection		✓
Host coloring support		✓
Command line scripting support		✓ Corporate License required
Price	Free	\$ 1 300 USD
	Download NetworkMiner (free edition)	Buy NetworkMiner Professional

** Fingerprinting of Operating Systems (OS) is performed by using databases from [Satori](#) and [p0f](#)*

1. Downloaded the zip folder (free edition) from Netresec's official website:
<https://www.netresec.com/?page=NetworkMiner#networkminer-download>.
2. Unzipped the file and ran the installer as administrator.
3. The installation was straightforward as I didn't get additional prompts.

Conclusion

I successfully set up both tools on my host OS and encountered no challenges. The only thing left is to get hands-on with the tools, especially Network Miner.
